

# Maya Chen

Selected Technical Portfolio | Synthetic Demo

maya.chen.demo@example.com

Boston, MA

Expected May 2028

## PORTFOLIO OVERVIEW

I build reliable, human-reviewed AI tools for education and career access. My work emphasizes traceable evidence, deterministic business rules, and clear user control.

### 01 CAMPUS OPPORTUNITY NAVIGATOR

|              |                                                                                                  |
|--------------|--------------------------------------------------------------------------------------------------|
| Challenge    | Students had career information spread across resumes, portfolios, and notes.                    |
| Contribution | Designed a LangGraph workflow for extraction, validation, confirmation, and SQL persistence.     |
| Technology   | Python, LangGraph, LangChain, Amazon Bedrock, AWS S3, Streamlit, SQL                             |
| Outcome      | Produced explainable profile summaries while keeping the student in control of every saved fact. |

### 02 STUDY GROUP MATCHER

|              |                                                                                           |
|--------------|-------------------------------------------------------------------------------------------|
| Challenge    | Students needed compatible study partners without exposing private records.               |
| Contribution | Implemented transparent scoring rules, SQL persistence, and a Streamlit review interface. |
| Technology   | Python, SQLAlchemy, SQLite, Streamlit, pytest                                             |
| Outcome      | Tested the complete prototype with synthetic records and documented privacy boundaries.   |

## ADDITIONAL EVIDENCE

- Led code reviews and release planning for a four-person student team.
- Wrote evaluation plans for retrieval quality and failure analysis.
- Interested in machine learning engineering, AI product engineering, and responsible education technology.

## NEXT DEVELOPMENT GOALS

Production MLOps, retrieval evaluation, cloud deployment, observability, and infrastructure as code.

Synthetic document created exclusively for the CareerTrace AI judge demo. All people, organizations, projects, and metrics are fictional.
